

RESOL press release

Hattingen, 26/05/2009

RESOL FlowCon[®] Sensor is among the Top 10 at the 2009 Intersolar Award

The announcement of the Intersolar Award nomination for the newly developed FlowCon[®] Sensor pump station invoked great joy in the small German town of Hattingen. The 160 RESOL employees eagerly anticipate the disclosure of the winning products.

The new pump station is full of intricate ideas, and its development required intensive effort and long-term field testing. To cut it short: a lot of work is accumulated in it – and an enormous innovation potential. But that only makes the joy about the public appreciation even greater for the RESOL team.

With the FlowCon[®] Sensor, the German family business introduces the first really complete pump station: a pump station that comes with all electronic components – including the sensors required. The installer does not have to mount separate store and collector sensors, as the sophisticated control algorithm and the integrated Grundfos Direct Sensors[™] take over their tasks.

Thus, the FlowCon[®] Sensor requires less installation effort than a conventional station. Additionally, the RESOL engineers took special care in simplifying the parametrisation of the station, so that the adjustments can easily be made by an inexperienced person. Hence, utmost reliability and an outstanding yield stability are ensured.

RESOL founder Rudolf Pfeil would be thrilled to add the Intersolar Award to the many honours his company has already received. “Our efforts to be leading our field with the whole spectrum of our work has already been rewarded with a number of awards,” the General Manager says. “Several red dot awards, two iF Design awards, an ISH Design Plus Award and the title of solar enterprise 2000 make an impressive gallery in our headquarters.” On the first day of the Intersolar trade fair in Munich, he will learn if another space in the gallery will soon be filled.

Walking new paths is nothing new to the RESOL team. For more than 30 years now, the company has been setting standards in the field of solar thermal control technology. The innovative ability and the high quality standard have made RESOL the world market leader – the devices produced in Hattingen optimise solar efficiency in almost three million solar systems all around the world.
